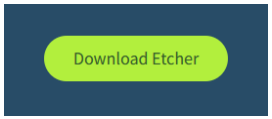
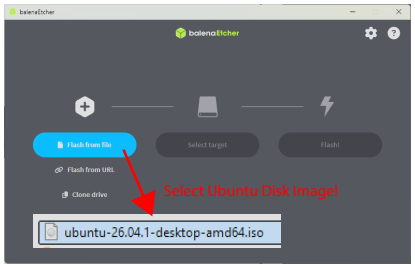
Download Ubuntu (Disk Image)
(https://ubuntu.com/download/desktop)

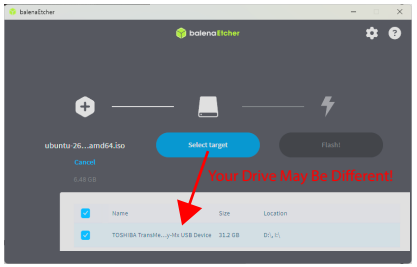
Plug your least-favorite 32+ GB Flash Drive into your computer

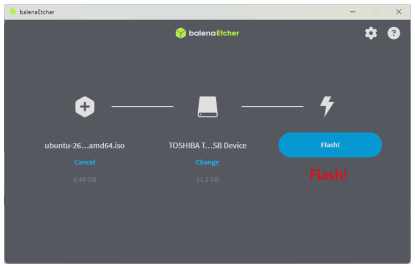
Download and install Balena Etcher
(https://etcher.balena.io/)



Flash The Ubuntu Disk Image to your Flash Drive Using Balena Etcher

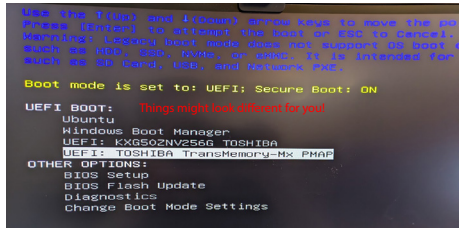


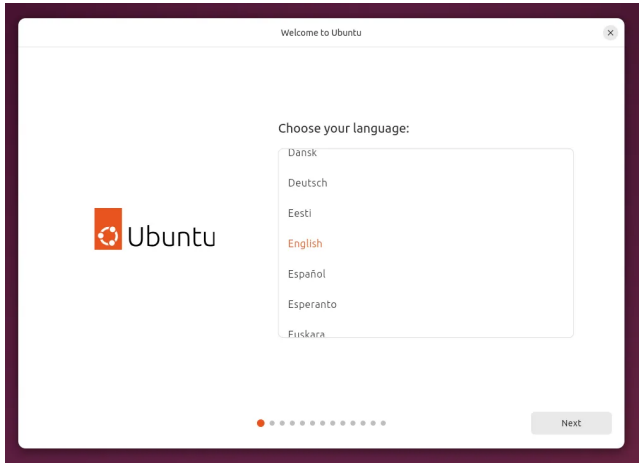




Plug the flash drive into the computer you want to put Linux (Ubuntu) On

Then, boot from the flash drive by selecting it from the BIOS Boot Priority or Boot Options Menu (Note: Getting to these options varies from machine to machine, usually mashing the delete, F2, or F12 keys is a good start. If you get to something that looks like its from 1993, you're in the right place; The internet can help here).





Choose to "Install Ubuntu" when prompted, and follow the directions once you get to this (<-) screen. Most of what it will ask you for is basic information, but, IMPORTANTLY, depending on your choices the installation WILL ERASE ALL INFORMATION ON YOUR DISK, so DO NOT proceed beyond this point unless your data is backed up properly. It WILL be gone, forever!

(Note: It's okay if you've gotten to this point without backing your data up, it's still there, just don't go PAST this point if you're not ready for it to be gone!)
